1 SCOPE OF WORK

Background

- 1.1 At the request of Statera Energy, RPS Consulting Services Limited (RPS) has prepared a site-specific Flood Risk Assessment (FRA) to support the application for the development of a Battery storage facility and associated infrastructure. The site is located north of Thame Lane, Culham, OX14 3GY. The assessment has been undertaken in accordance with the National Planning Policy Framework (NPPF) and Planning Practice Guidance (PPG).
- 1.2 The key objectives of the FRA are to:
- assess the flood risk to the proposed development and to demonstrate the feasibility of appropriately designing the development such that any residual flood risk to the development and users would be acceptable;
 - assess the potential impact of the proposed development on flood risk elsewhere and to demonstrate the feasibility of appropriately designing the development such that the development would not increase flood risk elsewhere; and
 - satisfy the requirements of the NPPF and Planning Practice Guidance which require FRAs to be submitted in support of planning applications for development over 1 ha in area.
- 1.3 Developments that are designed without regard to flood risk may endanger lives, damage property, cause disruption to the wider community, damage the environment, be difficult to insure and require additional expense on remedial works. Current guidance on development and flood risk identifies several key aims for a development to ensure that it is sustainable in flood risk terms. These aims are as follows:
- the development should not be at a significant risk of flooding and should not be susceptible to damage due to flooding;
 - the development should not be exposed to flood risk such that the health, safety or welfare of the users of the development, or the population elsewhere, is threatened;
 - normal operation of the development should not be susceptible to disruption as a result of flooding;
 - safe access to and from the development should be possible during flood events;
 - the development should not increase flood risk elsewhere;
 - the development should not prevent safe maintenance of watercourses or maintenance and operation of flood defences;
 - the development should not be associated with an onerous or difficult operation and maintenance regime to manage flood risk. The responsibility for any operation and maintenance required should be clearly defined;
 - future users of the development should be made aware of any flood risk issues relating to the development;
 - the development design should be such that future users will not have difficulty obtaining insurance or mortgage finance, or in selling all or part of the development, as a result of flood risk issues;
 - the development should not lead to degradation of the environment; and
 - the development should meet all of the above criteria for its entire lifetime, including consideration of the potential effects of climate change.
- 1.4 The FRA is undertaken with due consideration of these sustainability aims.

Project Scope

1.5 This FRA has the following structure:

- Sections 2 and 3 identify the sources of information that have been consulted in preparation of the report;
- Sections 4 and 5 describe the site location and the existing and proposed site development layout;
- Section 6 provides a hydrological review off the site and undertakes an FRA of the proposed development scheme;
- Section 7 describes the sites vulnerability status in line with the NPPF and PPG;
- Section 8 describes the runoff characteristics and drainage of the site;
- Section 9 provides a summary and conclusion to the report.

2 SOURCES OF INFORMATION

Introduction

2.1 Table 1 below lists the information sources consulted during preparation of this report.

Table 1: Information sources consulted during preparation of the report.

Source	Data	Notes
Ordnance Survey	OS Mapping 1: 50 000	Area information, rivers and other watercourses, general site environs, built environment, catchment Information
British Geological Survey	BGS (online) Geology of Britain Viewer	Site and area geology
Environment Agency (EA)	EA data holdings, customer service and engagement team	Current flood risk, local flood defences, flood levels, supplementary geology and groundwater information
Local Planning Authority (LPA) South Oxfordshire District Council	South Oxfordshire Local Plan	Flood Zoning Local Development Framework
UK Government: Department for Communities and Local Government	NPPF Planning Practice Guidance	Flood zoning for the site as used by the EA in England

2.2 The Reports consulted during the preparation of the document are listed below:

Table 2: Reports consulted during preparation of the document

Source	Data	Information consulted/ provided
Oxfordshire County Council	Oxfordshire County Council Local Flood Risk Management Strategy	Current Flood Zone / risk to the site including historical flooding locations Any relevant flood modelling complete for the site
EA	Thames: Catchment Flood Management Plan December 2009	Flood risk management policies

Legislation and Guidance

National Planning Policy Framework

- 2.3 The National Planning Policy Framework (NPPF) was released in March 2012 and was last updated in December 2023. The document sets out Government planning policies for England and how these are expected to be applied. The framework acts as guidance for local planning authorities and decision-takers, both in drawing up plans and making decisions about planning applications.
- 2.4 Section 14 sets out the need for an appropriate assessment of flood risk. Guidance on the minimum requirements for such an assessment is contained in PPG ID7.
- 2.5 The NPPF requires the application of a sequential risk-based approach to determining the suitability of land for development in flood risk areas, and that flood risk assessment should be carried out to the appropriate degree, at all levels of the planning process.

- 2.6 Footnote 55 identifies that ‘A site-specific flood risk assessment should be provided for all development in Flood Zones 2 and 3. In Flood Zone 1, an assessment should accompany all proposals involving: sites of 1 hectare or more; land which has been identified by the Environment Agency as having critical drainage problems; land identified in a strategic flood risk assessment as being at increased flood risk in future; or land that may be subject to other sources of flooding, where its development would introduce a more vulnerable use’.

Planning Practice Guidance

- 2.7 PPG ID7 Flood Risk and Coastal Change provides guidance to ensure the effective implementation of the NPPF planning policy for development in areas at risk of flooding.

Legislative background

- 2.8 Following the implementation of the Flood and Water Management Act 2010 local flood risk has become the responsibility of the Local Planning Authority. The Act places new duties on upper tier Councils, by designating them as Lead Local Flood Authorities (LLFAs) for the coordination of local flood risk management in their respective administrative areas.
- 2.9 From April 6, 2015, the responsibility for drainage and surface water management design approval resides with the local planning authority and should be submitted as part of the planning process.
- 2.10 The local planning authority has responsibility for the approval of proposed drainage systems in new developments and redevelopments. Approval must be given before any developer can commence construction. In order to be approved, the proposed drainage system would have to meet national standards for sustainable drainage.
- 2.11 The local planning authority is also responsible for adopting and maintaining SuDS which serve more than one property, which they have approved. The Highways Authorities will be responsible for maintaining SuDS in public roads to National Standards.
- 2.12 The SuDS Manual C753 sets out the criteria by which the form of drainage appropriate to any particular site or development can be determined, as well as requirements for the design, construction, operation and maintenance of SuDS.
- 2.13 Additional guidance for the use of SuDS is provided via CIRIA and BRE in the following:
- C609 Sustainable drainage systems. Hydraulic, structural and water quality advice (Superseded by C697 but remains current)
 - C156 Infiltration Drainage – Manual of Good practice
 - BRE Digest 365 Soakaway design

Climate Change

- 2.14 The NPPF and supporting planning practice guidance on Flood Risk and Coastal Change explain when and how flood risk assessments should be used. This includes demonstrating how flood risk will be managed now and over the development’s lifetime, taking climate change into account.

Peak River Flow Allowances

- 2.15 In May 2022, the EA last updated advice on climate change allowances to support the NPPF. Peak river flow allowances show the anticipated changes to peak flow by management catchment. Management catchments are sub-catchments of river basin districts. Peak River Flow Allowances should be considered for locations that are currently in Flood Zone 1 but might be in Flood Zone 2 or 3 in the future.
- 2.16 EA guidance on the application of climate changes allowance is dependent on the proposed developments vulnerability. As the development is a Battery Storage facility this application is deemed as Essential Infrastructure. The EA require that for Essential Infrastructure developments located in Flood Zones 2, 3a or 3b, the higher central allowance should be used to assess climate

change. Battery Storage developments have a lifetime of 40 years therefore will fall into the 2060s epoch.

- 2.17 The proposed Culham site is located within the Gloucestershire and the Vale Management Catchment for which the following peak river flow allowances are applicable.

Table 3: Gloucestershire and the Vale Management Catchment Peak River Flow Allowances

Epoch	Central	Higher Central	Upper End
2020s	11%	17%	33%
2050s	11%	19%	43%
2080s	26%	41%	84%

- 2.18 Based on the lifetime of the development and the vulnerability classification, an allowance of 19 – 41% is appropriate. As the Peak River Flow Allowances are considered to ensure the safety of people using the development when planning safe access, escape routes and places of refuge, it is unlikely that this will be a pertinent focus for this development. However, for completeness, comment will be made on this in Section 6.

Peak Rainfall Allowances

- 2.19 Peak Rainfall Allowances are used to consider how increased rainfall affects surface water flood risk and the design of drainage systems to manage the increased rainfall.

- 2.20 New guidance requires that for developments with a lifetime of between 2061 and 2100, Flood Risk Assessments and Strategic Flood Risk Assessments should assess the central allowances for the 2070s epoch for both the 1% and 3.3% annual exceedance probability events. The proposed Culham site is located within the Gloucestershire and the Vale Management Catchment for which the following Peak Rainfall Allowances are applicable.

Table 4: Gloucestershire and the Vale Management Catchment Peak Rainfall Allowances

3.3% Annual Exceedance Rainfall Event		
Epoch	Central	Upper
2050s	20%	35%
2070s	25%	35%
1% Annual Exceedance Rainfall Event		
Epoch	Central	Upper
2050s	20%	40%
2070s	25%	40%

- 2.21 Based on the above information, an allowance of 20 - 25% is appropriate. RPS have taken a conservative approach to the design of the conceptual drainage system and added 40% to all attenuation / runoff calculations for the development to account for climate change.

Local Planning Policy

- 2.22 The South Oxfordshire District Council Local Plan 2035 was adopted on 10th December 2020. The Local Plan contains the following policy relating to flood risk and drainage:

Policy EP4: Flood Risk

1. The Risk and impact of flooding will be minimised through:
 - i.) Directing new development areas with the lowest possibility of flooding;

- ii.) *Ensuring that all new development addresses the effective management of all sources of flood risk;*
- iii.) *Ensuring that development does not increase the risk of flooding elsewhere; and*
- iv.) *Ensuring wider environmental benefits of development in relation to flood risk.*
- 2. *The suitability of development proposed in Flood Zones will be strictly assessed using the 'Sequential Test' and where necessary the 'Exceptions Test'. A sequential approach should be used at site level.*
- 3. *A site-specific Flood Risk Assessment (FRA) should be provided for all developments in Flood Zones 2 and 3. In Flood Zone 1 an FRA should accompany all proposals involving:*
 - *sites of 1 hectare or more;*
 - *land which has been identified by the Environment Agency as having critical drainage problems;*
 - *land identified in the Strategic Flood Risk Assessment as being at increased flood risk in future; or*
 - *land that may be subject to other sources of flooding, where development would introduce a more vulnerable use.*
- 4. *All development proposals must be assessed against the current South Oxfordshire Strategic Flood Risk Assessment or any updates and the Oxfordshire Local Flood Risk Management Strategy to address locally significant flooding. Appropriate mitigation and management measures must be implemented and maintained.*
- 5. *All development will be required to provide a Drainage Strategy. Development will be expected to incorporate Sustainable Drainage Systems and ensure that run-off rates are attenuated to greenfield run-off rates. Higher rates would need to be justified and the risks quantified. Development should strive to reduce run-off rates for existing developed sites.*
- 6. *Sustainable Drainage Systems should seek to enhance water quality and biodiversity in line with the Water Framework Directive.*

2.23 The South Oxfordshire District Council SFRA identifies and maps flood risk from all sources at a borough-wide scale as well as providing guidance on producing site specific FRAs. Relevant information from the SFRA has been referenced throughout this FRA report.

3 CONSULTATION

Environment Agency

- 3.1 The FRA has been prepared in consultation with the Partnership and Strategic Overview Team at the EA. The EA has been contacted with request for information for the flood history in the area and any other flood related issues at the site. A response was received on 10th January 2023. The EA confirmed that they do not have any detailed flood risk modelling for the site. The full response is provided in Appendix A for reference.

Lead Local Flood Authority

- 3.2 The site is within the administrative boundary of Oxfordshire County Council, who act as the LLFA for the site. Consultation has been undertaken with the Flood Team regarding any information relating to flood risk and drainage.
- 3.3 The LLFA confirmed that they do not hold data for any historical flood events that have occurred in the vicinity of the site. The full response is provided in Appendix B for reference.

Internal Drainage Board

- 3.4 The site is not located within an IDB District

4 SITE SETTING

Site Location

- 4.1 The site is located at National Grid Reference SU 52952 96447, is irregular in shape and occupies an area of approximately 25.13 hectares (ha). The site location is presented in Figure 1.

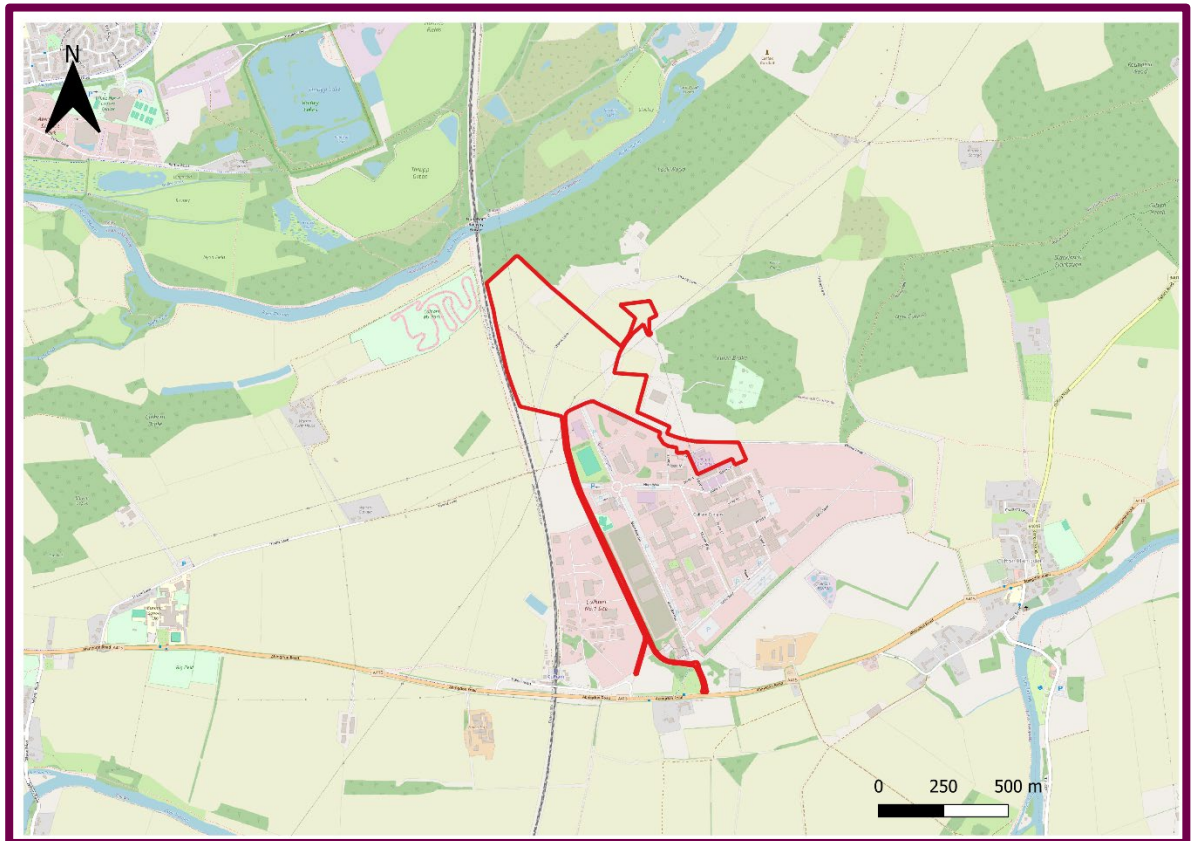

Figure 1: Site Location

- 4.2 The site is currently occupied by greenfield, which is used for agricultural purposes. Vehicular and pedestrian access to site is via Thame Lane which currently passes through the site. The site comprises approximately 95% soft landscaping cover and 5% hardstanding.

Surrounding Land Uses

- 4.3 The site is bounded to the north and east by undeveloped greenfield land. Wooded areas lie beyond the greenfield land which are named as Lock Wood and Furze Brake to the north and east respectively.
- 4.4 The Didcot and Chester Railway Line runs along the western edge of the site.
- 4.5 Culham Science Centre is located to the south of the site.
- 4.6 There are no designated sensitive areas, e.g. Special Area of Conservation (SAC), Special Protection Area (SPA) or Site of Special Scientific Interest (SSSI) within close proximity to the site. The Culham Brake SSSI is located approximately 1.8km west of the site.

Topography

- 4.7 A topographic survey was completed by Beacon Land Surveys in August 2022, reference 22-059-01. The survey indicates that the site generally falls in a south easterly direction with levels of approximately 74.69m AOD along the north-eastern boundary of the site, falling to approximately 63.77m AOD along the south-western boundary. The topographic survey is located in Appendix C.

5 PROPOSED DEVELOPMENT

- 5.1 It is understood that a planning application is sought for the construction of a Battery Storage Facility with associated infrastructure consisting of;
- Substations;
 - Inverters and transformers;
 - Battery Containers with a loose gravel surface;
 - Access roads and hardstanding for parking;
 - Associated car parking and control kiosk;
 - 1.5 m high Fencing; and
 - Landscaping including hedgerows and woodland planting.
- 5.2 Development plans are shown in Appendix D.
- 5.3 Site access will be via a track leading to the south of the site, onto Thame Lane.
- 5.4 The proposed use of the site is classified as 'Essential Infrastructure' within the PPG.
- 5.5 The potential to provide surface water attenuation, including the use of Sustainable Drainage Systems (SuDS), has been considered as part of the preliminary design process (see Section 10 – Surface Water Management).

6 FLOOD RISK ASSESSMENT

Hydrological Overview

- 6.1 OS Mapping indicates that the nearest main watercourse feature is located approximately 500m north of the site and is considered to be stretch of the River Thames, which is alternatively known as the River Isis within the region, from its source in the Cotswolds until the confluence with the Thame in Oxfordshire. A further branch of the River Thames is also located approximately 2 km south of the site.
- 6.2 Located approximately 1.3km to the west of the site is Swift Ditch which is an artificial channel which is linked/feeds into the River Thames.
- 6.3 The site is not tidally influenced and there appears to be no culverted watercourses within the vicinity of the site.
- 6.4 No other significant artificial features such as canals and reservoirs have been identified within 1km of the site.

Fluvial and Tidal Flooding

- 6.5 The EA Flood Map for Planning, which is available online, indicates that the site is located within Flood Zone 1, which is land assessed as having a less than 1 in 1,000 annual probability of river or sea flooding. The EA Flood Map for Planning is provided in Figure 2.

Figure 2: EA Flood Map for Planning (River and Sea)

- 6.6 As the site is located a significant distance in land, the site is not considered to be at risk from tidal sources.

EA Flood Warning Area

- 6.7 The EA defines a Flood Warning Area as “geographical areas where we expect flooding to occur and where we provide a Flood Warning Service. They generally contain properties that are expected

to flood from rivers or the sea and in some areas, from groundwater.” The site is not located in a Flood Warning Area.

Surface Water Flood Risk Classification

- 6.8 The EA’s updated Flood Map for Surface Water, which is available online, identifies areas at risk of surface water flooding. The classification of the risk is based on the following annual probability of flooding:
- High risk; area has a chance of flooding greater than 1 in 30.
 - Medium risk; area has a chance of flooding between 1 in 30 and 1 in 100.
 - Low risk; area has a chance of flooding between 1 in 100 and 1 in 1000.
 - Very low risk; has a chance of flooding less than 1 in 1000.
- 6.9 The EA surface water map indicates that the vast majority of the site is at a ‘Very Low’ risk of surface water flooding.
- 6.10 Small discrete areas of ‘Low’ risk are identified within the eastern portion of the site and along Thame Lane adjacent to the southern boundary. During a low-risk scenario, depths within these areas do not exceed 0.3m, with velocities between 0.25 – 1.00 m/s.
- 6.11 The updated Flood Map for Surface Water is presented in Figure 3.

Figure 3: Flood Map for Surface Water

Reservoir Flooding Flood Risk Classification

- 6.12 The Flood Risk from Reservoirs Map indicates that the site is not at risk of reservoir flooding. Reservoir regulation ensures that reservoirs are stringently inspected and supervised by qualified civil engineers and that any required maintenance or upgrade works are carried out quickly. This helps ensure that the likelihood of one of them failing remains extremely low.

Groundwater Flooding

- 6.13 British Geological Survey (BGS) online mapping (1:50,000 scale) indicates that the site is situated on Lower Greensand Group, comprising sandstone. There are no records of superficial deposits at the site.
- 6.14 No available BGS borehole logs are located within the surrounding area.
- 6.15 The soils are described as ‘freely draining slightly acid sandy soils’ by the National Soils Research Institute.
- 6.16 According to the MAGIC’s Aquifer Designation Mapping, the Lower Greensand Group is classified as a Secondary A aquifer. These formations are formed of permeable layers capable of supporting water supplies at a local scale, in some cases forming an important source of base flow to rivers.
- 6.17 MAGIC’s online groundwater Source Protection Zone (SPZ) mapping indicates that the site is not located within a groundwater SPZ.
- 6.18 An intrusive ground investigation was carried out by Geo-Environmental Services Ltd (ref: GE21162/SA01/221006) to inform the emerging drainage strategy for the proposed development. The ground investigation consisted of three dynamic windowless boreholes to the depths of up to 5.0m below ground level (bgl).
- 6.19 The data collected from the ground investigation at the site is summarised in Table 5 below. For the full results of the intrusive ground investigation please see Appendix E.

Table 5: Borehole Ground Investigation Results

Borehole Name	Borehole Location	Borehole depth (m)	Deposits	Groundwater Strikes
WS1	North-east of the site	3.70 m	Summertown Radley sand and Gravel Member Superficial deposits of light brown silty gravelly fine, medium sand and some rootlets.	No groundwater strikes were recorded at this borehole
WS2	South of the site	4.70m	Summertown Radley sand and Gravel Member Stratum was described as brown silty medium with some rootlet topsoil.	Groundwater strikes were recorded at 3.18 bgl.
WS3	North of the site	5.0 m	Summertown-Radley Sand and Gravel Member The stratum was described as brown slightly silty gravelly medium Sand with some rootlets and topsoil.	Groundwater strikes were recorded at 4.95m bgl

- 6.20 Overall, Borehole WS2 and Borehole WS3 both recorded ground water strikes. WS2 had groundwater from depths of 2.6m below ground level (bgl). In WS3, groundwater strikes were recorded at 4.95m bgl immediately after drilling but had dropped to a depth below 5.00m bgl in the monitoring standpipe after 2.5 hours.

Soakaway Testing

- 6.21 Percolation Tests help to determine whether the ground conditions are suitable for soakaway installation, by analysing the water absorption rate of the soil, which indicates how quickly the soil seeps down.
- 6.22 BRE365 testing provides the information on carrying information for calculating soil infiltration (percolation) rates as well. Soakaways should discharge from full to half-volume within 24 hours.
- 6.23 Soakaway testing was carried out in accordance with BRE365 and was undertaken in trial pits TP1 to TP4. In trial pits TP1 and TP3, Test 1 was abandoned, and Test 2 commenced at the end of the first day of testing when it became apparent that Test 1 would conclude during the night and accurate measurements would not be possible.

- 6.24 The test results have been summarised in Table 6 below. For the full results of the investigation please see Appendix E.

Table 6. Soakage Test Results

Location	Pit Depth (m bgl)	Permeability (m/s)		
		Test 1	Test 2	Test 3
TP1	1.70	$2.6 \times 10^{-6*}$	2.6×10^{-6}	$1.9 \times 10^{-6*}$
TP2	1.90	1.4×10^{-5}	1.1×10^{-5}	8.7×10^{-6}
TP3	1.60	$3.3 \times 10^{-6*}$	2.9×10^{-6}	$2.8 \times 10^{-6*}$
TP4	2.00	2.7×10^{-6}	Insufficient time to complete further tests	

Note: * based on data extrapolation

Sewer/Water Main Failure Assessment

- 6.25 No drainage records have been provided for the site. The land is currently agricultural land and therefore it is assumed that no artificial drainage systems will be present within the site area.
- 6.26 It is assumed that sewer and surface water drainage will have been designed to industry standards (e.g. Sewers for Adoption). However, the most common causes of flooding from sewers are; inadequate flow capacity, blockages, pumping station failures, burst water mains, water inflow from rivers or the sea, tide locking, siltation, fats/greases, and sewer collapse. Should any of these events occur there is a risk of flooding by surcharge where the flows are in excess of the sewer capacity (usually 1 in 30 year events or greater).
- 6.27 Taking into account the above and absence of any historical sewer flooding the overall risk of flooding via artificial drainage system to the site has been assessed as low.

7 FLOOD RISK VULNERABILITY CLASSIFICATION

Vulnerability Classification

- 7.1
- In accordance with the Flood Risk Vulnerability Classification in Table 2 of the Planning and Practice Guidance Flood Risk and Coastal Change, the Battery storage facility is classified as an ‘Essential Infrastructure’ development in flood risk terms.
- 7.2
- The built development associated with the application site is located within an area identified as Flood Zone 1. Table 3 of Planning Practice Guidance (Table 4 of this report) indicates that all uses are acceptable for locations in Flood Zone 1.

Table 7: Flood Risk Vulnerability and Flood Zone ‘Compatibility’

Flood Risk Vulnerability classification (see Table 3 of Planning Practice Guidance)	Essential Infrastructure	Water Compatible	Highly Vulnerable	More Vulnerable	Less Vulnerable
Zone 1	Yes	Yes	Yes	Yes	Yes
Zone 2	Yes	Yes	Exception test required	Yes	Yes
Zone 3a	Exception test required	Yes	No	Exception test required	Yes
Zone 3b Functional Floodplain	Exception test required	Yes	No	No	No

Key: Yes: Development is appropriate, No: Development should not be permitted.

8 DRAINAGE

Surface Water and Drainage Strategy

- 8.1 The sustainable management of surface water is an essential element of reducing future flood risk to the site and its surroundings.
- 8.2 Undeveloped sites generally rely on natural drainage to convey or absorb rainfall, the water soaking into the ground or flowing across the surface into watercourses.
- 8.3 The effect of development is generally to reduce the permeability of at least part of the site, which markedly changes the site's response to rainfall. Without specific measures to manage surface water the volume of water and peak flow rate are likely to increase. Inadequate surface water drainage arrangements can threaten the development itself and increase the risk of flooding to others.
- 8.4 Surface water arising from a developed site should as far as is practicable be managed in a sustainable manner to mimic the surface water flows arising from the site prior to the proposed development while reducing the risk of flooding at the site and elsewhere, taking climate change into account.

Sustainable Drainage Options

- 8.5 The NPPF and associated Planning Practice Guidance ID7 and CIRIA C753 SUDS Manual (2015) promotes sustainable water management through the use of SuDS. A hierarchy of techniques is identified:
1. Prevention – the use of good site design and housekeeping measures on individual sites to prevent runoff and pollution (e.g. minimise areas of hard standing).
 2. Source Control – control of runoff at or very near its source (such as the use of rainwater harvesting).
 3. Site Control – management of water from several sub-catchments (including routing water from roofs and car parks to one/several large soakaways for the whole site).
 4. Regional Control – management of runoff from several sites, typically in a detention pond or wetland.
- 8.6 The implementation of SuDS as opposed to conventional drainage systems, provides several benefits by:
- Reducing peak flows to watercourses or sewers and potentially reducing the risk of flooding downstream;
 - Reducing the volumes and frequency of water flowing directly to watercourses or sewers from developed sites;
 - Improving water quality over conventional surface water sewers by removing pollutants from diffuse pollutant sources;
 - Reducing potable water demand through rainwater harvesting;
 - Improving amenity through the provision of public open spaces and wildlife habitat; and
 - Replicating natural drainage patterns, including the recharge of groundwater so that base flows are maintained.

Runoff Calculations

- 8.7 The greenfield nature of the site means that surface water will slowly soak into the ground (infiltrate), be intercepted by vegetation or run off by way of overland flow, according to the soil characteristics and following the topography of the site.
- 8.8 Impermeable areas for the site have been calculated allowing for the following:

- Crushed Stone Tracks
- Batteries
- Inverter Houses
- Transformers
- Control Rooms
- Spare Parts Containers
- Water Tanks

8.9 To ensure that the development manages surface water sustainably, an allowance has also been provided for the additional substation compounds associated with the development. As these areas will contain very limited hardstanding, the following impermeable allowances have been given for each substation area:

- NGET Adopted Compound – located to the north east of the site- comprises gantry with circuit breakers on gravel base – 20% impermeable area
- Statera owned Compound – located to the east of the site – comprises transformers located within a bunded area on gravel base – 30% impermeable area
- Extension to existing NGET substation – located to the south east of the site – comprises circuit breakers sat on permeable gravel surface – 20% impermeable area

8.10 Details of the substation areas and cross sections are provided with Appendix D.

8.11 Due to the nature of these areas, it is determined that there is no contamination potential, and additional lining of these areas does not need to be considered.

8.12 Greenfield runoff rates for the site have been calculated by way of Interim Code of Practice for Sustainable Drainage Systems (ICP SUDS). This implements a pro rata IOH124 methodology, for sites below 50ha in size. The runoff rates were calculated using the MicroDrainage software.

8.13 The following parameters were incorporated into the greenfield runoff calculations:

- Impermeable Area: 4.46 ha
- Average Annual Rainfall (SAAR): 600 mm/year
- Soil: 0.300
- Region No: 6

8.14 The calculation has been included for reference within Appendix F and outputs are summarised within Table 8.

Table 8: Greenfield Runoff (Based on a 4.46 ha area)

Return Period	Greenfield Runoff Rate (l/s)
Q1	5.8
QBar	6.8
Q30	15.4
Q100	21.6

Proposed Surface Water Drainage

- 8.15 The proposed surface water drainage system was designed using current MicroDrainage analysis software, taking into account planning, LLFA and EA guidance to prevent uncontrolled flooding of the site and surrounding area.
- 8.16 Methods of infiltration have been considered, however, in relation to other developments of a similar nature, the EA has highlighted that BESS sites have the potential to pollute the environment during emergency situations. In particular this relates to the potential to impact groundwater and surface water from potentially contaminated firewater runoff. Therefore, at this stage it has been deemed appropriate to consider SuDS which do not rely on infiltration. This will ensure surface water can be sustainability managed without posing a threat to the local environment in the event of a fire.
- 8.17 Based upon the impermeable area of 4.46ha and a calculated QBAR greenfield rate of 6.8l/s approximately 4,084m³ of attenuation storage would be required for a 1 in 100 year storm event plus 40% allowance for climate change. This is to be stored within an attenuation blanket.
- 8.18 Surface water runoff from the proposed development will be stored within lined Attenuation Blankets within the Gravel Compound Bases across the site. The Attenuation Blankets provide storage of 4800 m³. Water will be captured within lateral drains and stored prior to discharge, to the watercourse to the northwest of the site, at a restricted rate of 6.8 l/s.
- 8.19 The Indicative Drainage Layout is provided in Appendix G. Surface water runoff will be captured by a series of on-site filter drains, designed in accordance with the CIRIA C753 SuDS Manual. Each filter drain will contain a perforated pipe.
- 8.20 Surface Water will pass through a proprietary Vortex Grit Separator, to provide additional treatment of the surface water flows. The Attenuation Blanket will provide adequate storage for all storm events up to and including the 1 in 100-year return period with an additional 40% for future climate change, based on the MicroDrainage calculations provided in Appendix H.
- 8.21 Due to the nature of the development, at this stage, infiltration methods are deemed to be inappropriate.
- 8.22 The development site will be operated remotely, and so will not generate any foul drainage water. There is no requirement for any foul drainage provision on this site.

Management of Fire Water

- 8.23 In order to manage the risk associated with a highly unlikely fire event, the development will include both a provision for the supply of fire water via water tanks and/or hydrants, in addition containment of fire water used to suppress any fire.
- 8.24 The fire water requirement has been based on an approximate fire duration constituting 1 hour of intense burn followed by 6 hours of slow burn, a total 7-hour fire. To quench the fire a rough water flow rate of 4m³/hr has been assumed for the slow burn period, doubling for the intense burn period, equating to $(4\text{m}^3/\text{hr} * 6) + ((4\text{m}^3/\text{hr} * 2) * 1) = 32\text{m}^3$ of water required per container. As each container is situated adjacent to four other units a total of 128m³ of water is required. As a contingency, an additional c.122 m³ (near double additional water volume) will be provided.
- 8.25 Fire water will be stored on site within the main compound in either sectional steel panel tanks or cylindrical steel panel tanks. The total fire water provision stored will total 250 m³.
- 8.26 An onsite fire containment strategy will be incorporated into the overall site drainage design. It is proposed that a series of lined swales or interceptor channels will be located downgradient of battery storage units with a storage capacity of 250 m³. In the unlikely event of a fire the unit on fire will be left to burn out, in accordance with general guidance for Battery units, whilst water will be focussed on the adjacent battery units to ensure the fire is contained. As a consequence, the runoff generated is less likely to pose a contamination risk. Runoff used to cool the units will be initially intercepted and contained within the gravel bases. This will allow a compartmentalised approach to the containment of water in the event of a fire. Penstocks will be installed to allow further containment of potentially contaminated water for testing prior to either tanking offsite if contaminated, or alternatively discharged in accordance with the approved drainage strategy.

Construction Stage Drainage

- 8.27 During construction of the development, the building contractor will be responsible for management and disposal of rainwater runoff generated from the site in its temporary condition.
- 8.28 The contractor shall develop a formal site management plan, which will address pollution management and control in relation to site plant and vehicles, raw materials storage and waste generation, to ensure that all surface water runoff generated in the temporary condition will be free of contamination.
- 8.29 The site will be subject to topsoil strip and bulk earthworks to prepare the site to the correct level for development. The contractor shall provide temporary drainage measures to contain runoff within the development site boundary ensuring that this is sized appropriately, and that means to remove excess surface water are available for use at all times.

Water Quality / Pollution Control

- 8.30 Surface water run-off should be managed by SuDS that are designed to attenuate flows and to avoid water quality impacts downstream. To demonstrate that surface water arising from the development will be appropriately treated prior to discharge, the Simple Index Approach, as outlined within the SuDS Manual (CIRIA C753) has been followed.
- 8.31 As stated in the SuDS Manual 2015 (C753), the risk posed by surface water runoff to the receiving environment is a function of:
- the pollution hazard at a particular site (i.e. the pollutant source)
 - the effectiveness of SuDS treatment components in reducing levels of pollutants to environmentally acceptable levels, groundwater (i.e. the pollutant pathway)
 - the sensitivity of the receiving environment (i.e. the environmental receptor).
- 8.32 Table 26.2 of C753 (Table 9 of this report) provides details of various land uses and the associated pollution hazard levels. While there is no one category which exactly suits this development, the proposals are industrial in nature, so it is considered that applying a High Hazard Level would be the most appropriate, if not conservative. An extract of Table 26.2 is provided below.

Table 9: Pollution hazard indices for different land use classifications

TABLE 26.2 Pollution hazard indices for different land use classifications				
Land use	Pollution hazard level	Total suspended solids (TSS)	Metals	Hydrocarbons
Residential roofs	Very low	0.2	0.2	0.05
Other roofs (typically commercial/ industrial roofs)	Low	0.3	0.2 (up to 0.8 where there is potential for metals to leach from the roof)	0.05
Individual property driveways, residential car parks, low traffic roads (eg cul de sacs, homezones and general access roads) and non-residential car parking with infrequent change (eg schools, offices) ie < 300 traffic movements/day	Low	0.5	0.4	0.4
Commercial yard and delivery areas, non-residential car parking with frequent change (eg hospitals, retail), all roads except low traffic roads and trunk roads/motorways ¹	Medium	0.7	0.6	0.7
Sites with heavy pollution (eg haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels (other than domestic fuel oil) are to be delivered, handled, stored, used or manufactured; industrial sites; trunk roads and motorways ¹	High	0.8 ²	0.8 ²	0.9 ²

Notes

1 Motorways and trunk roads should follow the guidance and risk assessment process set out in Highways Agency (2006).

2 These should only be used if considered appropriate as part of a detailed risk assessment – required for all these land use types (Table 4.3). When dealing with high hazard sites, the environmental regulator should first be consulted for pre-permitting advice. This will help determine the most appropriate approach to the development of a design solution.

8.33 Table 26.3 of C753 (Table 10 of this report) indicates indicative pollution hazard level mitigation indices for different SuDS measures.

Table 10: Indicative SuDS mitigation indices for discharges to surface waters

TABLE 26.3 Indicative SuDS mitigation indices for discharges to surface waters			
Type of SuDS component	Mitigation indices ¹		
	TSS	Metals	Hydrocarbons
Filter strip	0.4	0.4	0.5
Filter drain	0.4 ²	0.4	0.4
Swale	0.5	0.6	0.6
Bioretention system	0.8	0.8	0.8
Permeable pavement	0.7	0.6	0.7
Detention basin	0.5	0.5	0.6
Pond ³	0.7 ³	0.7	0.5
Wetland	0.8 ³	0.8	0.8
Proprietary treatment systems ^{4,5}	These must demonstrate that they can address each of the contaminant types to acceptable levels for frequent events up to approximately the 1 in 1 year return period event, for inflow concentrations relevant to the contributing drainage area.		

Notes

1 SuDS components only deliver these indices if they follow design guidance with respect to hydraulics and treatment set out in the relevant technical component chapters.

2 Filter drains can remove coarse sediments, but their use for this purpose will have significant implications with respect to maintenance requirements, and this should be taken into account in the design and Maintenance Plan.

3 Ponds and wetlands can remove coarse sediments, but their use for this purpose will have significant implications with respect to the maintenance requirements and amenity value of the system. Sediment should normally be removed upstream, unless they are specifically designed to retain sediment in a separate part of the component, where it cannot easily migrate to the main body of water.

4 Where a wetland is not specifically designed to provide significantly enhanced treatment, it should be considered as having the same mitigation indices as a pond.

5 See Chapter 14 for approaches to demonstrate product performance. A British Water/Environment Agency assessment code of practice is currently under development that will allow manufacturers to complete an agreed test protocol for systems intended to treat contaminated surface water runoff. Full details can be found at: <http://tinyurl.com/qf7yuj7>

6 SEPA only considers proprietary treatment systems as appropriate in exceptional circumstances where other types of SuDS component are not practicable. Proprietary treatment systems may also be considered appropriate for existing sites that are causing pollution where there is a requirement to retrofit treatment. SEPA (2014) also provides a flowchart with a summary of checks on suitability of a proprietary system.

- 8.34 The information summarised in Table 11 below indicates that suitable pollution mitigation provision would be afforded through the use of filter drains, a grit separator and the attenuation blanket.

Table 11: Summary of Pollution Hazard and Mitigation Indices for Site and Proposed SuDS

Pollution	Pollution Hazard	SuDS Component	TSS	Metal	Hydro-carbons
Hazard Indices	High	-	0.8	0.8	0.9
SuDS Mitigation	-	Filter Drain	0.4	0.4	0.4
	-	Attenuation Blanket	0.7 ^T	0.6 ^T	0.7 ^T
	-	Grit Separator*	0.5 ^T	0.4 ^T	0.8 ^T
Total SuDS Mitigation	-	-	1	0.9	1.15

* Mitigation indices have been calculated using the Advanced Hydrodynamic Vortex Separator manufactured by Hydro International.

^T When designing in accordance with the SuDS Manual (Ciria C753), when two or more methods are used in sequence to target the same pollutant, only half of the mitigation index of the subsequent components should be allowed in the calculation.

Maintenance

- 8.35 The following information indicates the typical maintenance regimes, and not exhaustive, that will be considered within the detailed drainage design to ensure continued satisfactory operation of the site drainage systems. The maintenance activities would be split into three categories, namely Regular, Occasional & Remedial, as detailed in Table 32.1 of C753 (Table 12 of this report).

Table 12: SuDS components operation and maintenance activities

TABLE 32.1 Typical key SuDS components operation and maintenance activities (for full specifications, see Chapters 11–23)													
Operation and maintenance activity	SuDS component												
	Pond	Wetland	Detention basin	Infiltration basin	Soakaway	Infiltration trench	Filter drain	Modular storage	Pervious pavement	Swale/bioretention/trees	Filter strip	Green roofs	Proprietary treatment systems
Regular maintenance

Structure rehabilitation /repair	□	□	□	□	□	□	□	□	□	□	□	□	
Infiltration surface reconditioning				□	□	□	□		□	□	□		

Key

■ will be required

□ may be required

Notes

1 Sediment should be collected and managed in pre-treatment systems, upstream of the main device.

- 8.36 There may also be one-off requirements sometimes referred to as “establishment maintenance”, particularly for planting (e.g. weeding and watering). Regular maintenance consists of basic tasks carried out on a frequent and predictable schedule, including inspections/monitoring, silt or oil removal (if required more frequently than once per year), vegetation management, sweeping of surfaces and litter/debris removal.
- 8.37 Occasional maintenance comprises tasks that are likely to be required periodically, but on a much less frequent and predictable basis than the regular tasks. Guidance on the components pertinent to this drainage proposal are detailed below.
- 8.38 Remedial maintenance comprises the intermittent tasks that may be required to rectify faults associated with system, although the likelihood of faults can be minimised by good design, construction and regular maintenance activities. Where remedial work is found to be necessary, it is likely to be due to site-specific characteristics or unforeseen events, so timings are difficult to predict.
- 8.39 In addition to general cleaning of roof gutters and downstream sediment traps, Tables 13 to 16 indicate the minimum required maintenance regime that needs to be implemented post construction for the SuDS elements that will comprise the bulk of the proposed drainage system, including filter drains, grit separator, attenuation blanket and associated infrastructure.

Table 13: Proprietary Treatment Systems (Grit Separator) Maintenance Requirements

Maintenance schedule	Require Action	Typical Frequency
Routine Maintenance	Remove litter and debris and inspect for sediment, oil and grease accumulation	Six monthly
	Change the filter media	As recommended by manufacturer
	Remove sediment, oil, grease and floatables	As necessary – indicated by system inspections or immediately following significant spill
Remedial Actions	Replace malfunctioning parts or structures	As required
Monitoring	Inspect for evidence of poor operation	Six monthly
	Inspect filter media and establish appropriate replacement frequencies	Six monthly
	Inspect sediment accumulation rates and establish appropriate removal frequencies	Monthly during first half year of operation, then every six months

Table 14: Filter Drains Maintenance Requirements

Maintenance schedule	Require Action	Typical Frequency
Regular Maintenance	Remove litter (including leaf litter) and debris from filter drain surface, access chambers and pre-treatment devices	Monthly (or as required)
	Inspect filter drain surface, inlet/outlet pipework and control systems for blockages, clogging, standing water and structural damage	Monthly
	Inspect pre-treatment systems, inlets and perforated pipework for silt accumulation, and establish appropriate silt removal frequencies	Six monthly
	Remove sediment from pre-treatment devices	Six monthly, or as required
Occasional Maintenance	Remove or control tree roots where they are encroaching the sides of the filter drain, using recommended methods (eg NJUG, 2007 or BS 3998:2010)	As required
	At locations with high pollution loads, remove surface geotextile and replace, and wash or replace overlying filter medium	Five yearly, or as required
	Clear perforated pipework of blockages	As required

Table 15: Attenuation Blanket Maintenance Requirements

Maintenance schedule	Require Action	Typical Frequency
Regular Maintenance	Brushing and vacuuming (standard cosmetic sweep over whole surface)	Once a year, after autumn leaf fall, or reduced frequency as required, based on site specific observations of clogging or manufacturer's recommendations – pay particular attention to areas where water runs onto pervious surface from adjacent impermeable areas as this area is most likely to collect the most sediment
Occasional Maintenance	Stabilise and mow contributing and adjacent areas	As required
	Removal of weeds or management using glyphosate applied directly into the weeds by an applicator rather than spraying	As required – once per year on less frequently used pavements
Remedial Actions	Remediate any landscaping which, through vegetation maintenance or soil slip, has been raised to within 50 mm of the level of the paving	As required
	Remedial work to any depressions, rutting and cracked or broken blocks considered detrimental to the structural	As required

	performance or a hazard to users, and replace lost jointing material	
	Rehabilitation of surface and upper substructure by remedial sweeping	Every 10 to 15 years or as required (if infiltration performance is reduced due to significant clogging)
Monitoring	Initial inspection	Monthly for three months after installation
	Inspect for evidence of poor operation and/or weed growth if required, take remedial action	- Quarterly, 48 hr after large storms in first six months
	Inspect silt accumulation rates and establish appropriate brushing frequencies	Annually
	Monitor inspection chambers	Annually

Table 16: Inlet and Outlet Headwalls Maintenance Requirements

Maintenance schedule	Require Action	Typical Frequency
Regular Maintenance	Litter removal	As required
	Inspect vegetation above and around headwall and remove nuisance plants (for first 3 years)	Monthly (at start, then as required)
	Tidy all dead growth before start of growing season	Annually
	Remove sediment from aprons	Annually
	Flap valves and grilles: Check for and clear obstructions	Quarterly
Remedial Actions	Repair of erosion or other damage around headwalls	As required
Monitoring	Inspect structures for evidence of poor operation	Monthly/after large storms
	Inspect structures, pipework etc. for evidence of physical damage	Monthly/after large storms
	Inspect silt accumulation rates and establish appropriate removal frequencies	Half yearly
	Check flap valves	Half yearly

9 SUMMARY AND CONCLUSIONS

Summary

- 9.1 A site-specific Flood Risk Assessment (FRA) in accordance with the NPPF and PPG ID7 has been prepared to support the application for the development of a Battery facility and associated infrastructure.

Flood Risk

- 9.2 EA mapping shows that the site is located within Flood Zone 1, which is land assessed as having a less than 1 in 1,000 annual probability of river or sea flooding.
- 9.3 The majority of the site is at a 'Very Low' risk of surface water flooding. Small discreet areas of 'Low' risk are identified within the eastern portion of the site and along Thames Lane adjacent to the southern boundary. During a low-risk scenario, depths within these areas do not exceed 0.3m, with velocities between 0.25 – 1.00 m/s.
- 9.4 The site susceptibility to groundwater flooding has been assessed as low.
- 9.5 The site is not at risk of flooding from reservoir infrastructure failure.
- 9.6 The proposed development type is defined as 'Essential Infrastructure' in the NPPF and PPG.
- 9.7 There will be an increase in impermeable area at site, therefore surface water will be attenuated and discharged from the site via an attenuation blanket. MicroDrainage calculations indicate that the overall attenuation requirement for the development is approximately 4085 m³ for the 1 in 100 year storm event plus a 40% allowance for climate change.
- 9.8 The drainage strategy incorporates a number of surface water cleaning techniques in order that any discharges are as 'clean' as reasonably practicable.
- 9.9 The impacts of the increase in surface water runoff will be reduced by the incorporation of appropriate and practicable SuDS mitigations measures in the built design.

Conclusion

- 9.10 This FRA and supporting documentation illustrate that the development area is at low risk of flooding from all sources and meets the requirements of the NPPF and Planning Practice Guidance.

Subject: THM293876 Flooding Information Request (Product 4): Land North of Thame Lane, OX14 3GY

CAUTION: This email originated from outside of RPS.

Dear Jessica,

THM293876

Location of site: Land North of Thame Lane, OX14 3GY

Thank you for your email requesting Product 4 data.

We unfortunately do not have any detailed flood risk modelling in this location. We are sorry that we are therefore unable to provide modelled flood levels and extents for your site.

The Flood Map for Planning in this location is likely to be based on JFLOW data which is not suitable for use in site specific Flood Risk Assessments. Please advise if you would like to request JFLOW data for this location.

You can access our flood map for planning on our website:

<https://flood-map-for-planning.service.gov.uk/>

You can find more information on the long term risk of flooding for this location on our website:

<https://flood-warning-information.service.gov.uk/long-term-flood-risk>

You can find recorded flood outlines for this location via the link below:

<https://data.gov.uk/dataset/recorded-flood-outlines1>

You can find out the risk of flooding from surface water for this location via the link below:

<https://data.gov.uk/dataset/d5ca01ec-e535-4d3f-adc0-089b4f03687d/risk-of-flooding-from-surface-water-suitability>

You may be interested in the following guidance / information publically available:

- 'Planning Practice Guidance' - provides information about planning considerations in areas at risk of flooding. <https://www.gov.uk/government/collections/planning-practice-guidance>
- 'Planning applications: assessing flood risk' - information about completing Flood Risk Assessments. <https://www.gov.uk/guidance/flood-risk-assessment-for-planning-applications>
- 'Site specific flood risk assessment: Checklist' – a checklist to help ensure you have considered all the relevant factors in your flood risk assessment. <https://www.gov.uk/guidance/flood-risk-and-coastal-change#Site-Specific-Flood-Risk-Assessment-checklist-section>

Please be aware that from 20th July 2021 the climate change allowances required in flood risk assessments have been updated. Please see <https://www.gov.uk/guidance/flood-risk-assessments-climate-change-allowances#contents> for more information.

I hope that we have correctly interpreted your request. Please refer to our Open Government Licence for the permitted use of the supplied data: <http://www.nationalarchives.gov.uk/doc/open-government-licence/version/3/>

Please be aware that many of our datasets are now available online. Simply visit environment.data.gov.uk

We respond to requests for recorded information that we hold under the Freedom of Information Act 2000 (FOIA) and the associated Environmental Information Regulations 2004 (EIR).

Please get in touch if you have any further queries or contact us within two months if you'd like us to review the information we have sent.

Kind regards,

Customers & Engagement Team – **Thames**

Subject: Flooding Information Request (Product 4): Land North of Thame Lane, OX14 3GY

Dear Sir / Madam,

We would like to request flood risk assessment data (also known as a Product 4) for the Land North of Thame Lane, OX14 3GY (GRID REF: SU 52950 96434). We also would like to have any history of flooding at the site and any other flood related information. A map with the site boundary is attached below:

Kind regards,
Jessica

Appendix B – LLFA Consultation

Jessica Grady

From: Littler, Adam - Oxfordshire County Council <Adam.Littler@Oxfordshire.gov.uk>
Sent: 09 December 2022 15:33
To: Louisa Anscomb
Subject: Flood Risk Query: OX14 3GY

CAUTION: This email originated from outside of RPS.

Dear Louisa,

I note your following request for information.

RPS have been commissioned to prepare a Flood Risk Assessment for a development, for *Land north of Culham Science Park with the nearest post code being OX14 3GY*.

As part of our enquiries, could we please request the following:

- Details of any historic flooding from any source in the vicinity of the site
- Details of any culverted watercourses in the vicinity of the site
- Any flood modelling or mapping that the council has regarding the vicinity of the site
- Details of any known surface water drainage issues in the vicinity of the site

Do you have any site-specific comments and drainage constraints or requirements for this site?

The LLFA have checked our historic flood data base and we do not have any recorded flood events in the area provided below. It should be stressed that this is not to say it has not flooded but it means we do not have a record of it.

Please could I direct you to the link in the below signature for OCC LLFA Pre-Application service, should you choose this option the LLFA will be able to provide site specific steer to your proposals.

Kind regards,

Adam.

Appendix E – Ground Investigation Report

6th October 2022

Our ref: GE21162/SA01/221006

Oliver Troup
Statera Energy
145 Kensington Church Street
London
W8 7LP

By email

Dear Oliver,

RE: Land to the rear of Culham Science Centre, Culham, Abingdon, OX14 3DB – Letter Report

1. Introduction

Further to your instruction, we write to present the findings of the intrusive investigation undertaken at land to the rear of Culham Science Centre, Culham, Abingdon, OX14 3DB (Figure 1).

2. Proposed Development

The proposed development is understood to comprise a battery energy storage facility with associated infrastructure including a number of stormwater basins.

3. Objectives

The investigation was undertaken to inform the emerging drainage strategy for the proposed development.

4. Site Description

The site was located at NGR 452888, 196448 and was formed by an irregularly shaped parcel of land comprising sections of two grazing fields. The fields were separated by a concrete track initially running east to west in the very south of the site, before turning to run in a north-north-east direction through the centre of the site. Topographically, the site sloped gently downhill to the south.

Two strings of overhead electricity cables supported by pylons ran across the site. One string ran north to south through the western part of the site with one supporting pylon located in the northwest of the site. The second string of cables ran along the south-eastern boundary before crossing the eastern extend of the site. Two inspection chamber covers were observed in the northwest of the site to the south of the pylon in this area. When lifted, these appeared to be former soakaways. A trunk water main was mapped running southwest to northeast through the east of the site. Although no visible evidence of this utility was recorded, it was possible to trace its location using radio-detection techniques during the investigation.

The majority of the site boundaries did not coincide with any physical feature with the exception of the western boundary which was formed by post and wire fencing and a deciduous hedgerow. Access to the site was afforded by an external perimeter track around the Science Park accessed via the industrial estate to the southwest of the site.

A railway line within a cutting was located to the west of the site. A continuation of grazing fields, some woodland and cover crop (maize) were located to the north and northeast. A raised area covered by long grass with a number of deciduous trees was located to the east with a large warehouse type building approximately 200m beyond. An electricity pylon and small mobile telecommunications compound, surrounded by timber close-boarded fencing was located immediately adjacent to the southeast of the site with Culham Science Park beyond. The Science Park was secured by tall metal mesh fencing. Two further electricity pylons were located to the south

Geo-Environmental Services Ltd

Geo-Environmental Services Ltd incorporated in England number 3214980 VAT number 679544479

of the site in an area of long grass. One of these was noted to connect to a large substation located within the Science Park.

5. Fieldwork

The scope of works agreed with the Client comprised:

- Attendance of a Geo-Environmental Engineer to set out and supervise the intrusive investigation, undertake logging of recovered soils from exploratory holes and in-situ testing.
- Construction of 3No. dynamic windowless sampler boreholes (WS1 to WS3) to depths of up to 5.00m bgl.
- Installation of the boreholes with 3No. monitoring standpipes with upstanding covers to allow for future groundwater monitoring.
- Construction of 4No. machine excavated trial pits (TP1 to TP4) to depths between 1.60m and 2.00m bgl.
- Soakage testing in accordance with BRE365 undertaken in trial pits TP1 to TP4.
- 3No. return groundwater monitoring visits.
- Provision of a Letter Report.

The intrusive investigation was carried out on 27th, 28th and 29th September 2022. The positions were agreed with the Client but adjusted on site to avoid overhead and underground utilities. The locations of the exploratory holes are shown on Figure 2.

6. Ground Conditions

The ground conditions encountered by the investigation comprised a mantle of Topsoil overlying Summertown-Radley Sand and Gravel Member. A generalised summary of the encountered conditions is presented in Table 1.

Top (m bgl)	Base (m bgl)	Geology	Locations
0.00	0.20 – 0.35	TOPSOIL: Brown or light brown fine and medium SAND with low or moderate proportions of silt and gravel with occasional or some rootlets.	All
0.20 – 0.35	>1.60 – >5.00	SUMMERTOWN-RADLEY SAND AND GRAVEL MEMBER: Typically orange brown, but occasionally brown or light orange brown, medium or medium and coarse SAND with low to moderate silt and gravel content. Moderate clay content occasionally recorded. Silt and gravel also absent on occasion. Greenish grey and grey colouration, some decayed 5-10mm roots and natural organic odour recorded from 1.00m to 1.70m bgl in TP4.	All

Table 1 Summary of Ground Conditions

For further details of the ground conditions encountered, reference should be made to the exploratory hole logs in Appendix A.

8. Groundwater

Groundwater was encountered within WS2 at 3.18m bgl immediately after drilling, rising to 3.30m bgl with the installed monitoring standpipe after 3.5 hours. Groundwater was recorded at 4.95m bgl in WS3 immediately after drilling but had dropped to a depth of greater than 5.00m bgl in the monitoring standpipe after 2.5 hours. No other groundwater was encountered during the intrusive investigation.

Groundwater monitoring standpipes were installed within WS1 to WS3 in order to facilitate return spot monitoring of groundwater levels. 3No. groundwater monitoring visits are planned, upon completion this report will be updated to include the data collected.

The groundwater level in the 3No. monitoring standpipes was measured on 29th September 2022 (the final day of the investigation and two days following installation). No groundwater was recorded within the depth of the installed standpipes with the exception of WS2 where the water depth was recorded at 3.01m bgl.

It should be noted that changes in groundwater and perched water levels do occur for a number of reasons including seasonal effects and variations in drainage. Such fluctuations may only be recorded by the measurement of the groundwater level within a series of standpipes or piezometers installed within appropriate response zones.

9. Obstructions

Boreholes WS1 and WS2 refused on dense strata at depths of 3.70m and 4.70m bgl respectively. No other natural or manmade obstructions were encountered. Obstructions elsewhere on the site cannot be completely ruled out.

10. Soakaways

Soakage testing in broad accordance with BRE365 was undertaken in trial pits TP1 to TP4. Testing was undertaken on 28th and 29th September 2022 for the two day test period agreed with the Client.

The results of the testing are summarised in Table 2 below. The soakage test results are included within Appendix B. In trial pits TP1 and TP3 Test 1 was abandoned, and Test 2 commenced at the end of the first day of testing when it became apparent that Test 1 would conclude during the night when accurate measurement would not be possible.

Location	Pit depth (m bgl)	Permeability (m/s)		
		Test 1	Test 2	Test 3
TP1	1.70	2.6×10^{-6} *	2.6×10^{-6}	1.9×10^{-6} *
TP2	1.90	1.4×10^{-5}	1.1×10^{-5}	8.7×10^{-6}
TP3	1.60	3.3×10^{-6} *	2.9×10^{-6}	2.8×10^{-6} *
TP4	2.00	2.7×10^{-6}	Insufficient time to complete further tests	

NOTE: * - based on data extrapolation

Table 2 Soakage Test Results

In line with building control requirements soakaways should be located at least 5m from any structure.

11. Conditions

The data collected from the investigations have been used to provide an interpretation of the geotechnical and/or environmental conditions pertaining to the site. The recommendations and opinions expressed in this report are based on the data obtained. Geo-Environmental takes no responsibility for conditions that either have not been revealed in the available records, or that occur between or under points of physical investigation. Whilst every effort has been made to interpret the conditions, such information is only indicative and liability cannot be accepted for its accuracy.

A Discovery Strategy (Appendix C) should remain in force throughout groundworks and construction of the proposed development.

Information contained in this report is intended for the use of the Client and Geo-Environmental can take no responsibility for the use of this information by any party for uses other than that described in this report. Geo-Environmental makes no warranty or representation whatsoever express or implied with respect to the use of this information by any third party. Geo-Environmental does not indemnify the Client or any third parties against any dispute or claim arising from any finding or other result of this investigation report or any consequential losses.

This report remains the property of Geo-Environmental and the Client has no rights to, or reliance upon this document or supporting documents until such time as payment has been received in full for all invoices for works undertaken in connection with this report.

12. Closure

We trust that we have interpreted your instructions correctly. Please do not hesitate to contact us should you have any queries.

Yours sincerely
For and on Behalf of Geo-Environmental

The background of the page features a series of horizontal, wavy bands in various shades of blue, ranging from a deep navy to a light sky blue. These bands are layered and curved, creating a sense of movement and depth. The text is positioned in the upper left area of the page, above the main decorative elements.

APPENDIX C

Discovery Strategy

Discovery Strategy

Whilst an intrusive investigation has been undertaken on the site, it remains possible that unexpected ground and/or groundwater conditions may be encountered during the process of construction.

Should previously undiscovered contamination or unforeseen ground conditions be encountered during construction by the ground workers, this must be reported to the Site Manager immediately in order that the Consultant is notified.

Where deemed necessary, the Consultant shall attend the site to inspect the discovery and provide recommendations on the further actions required, if any. Where necessary the regulatory authority shall be informed. Post any additional investigation or laboratory testing the results and any proposed remedial measures shall be reported to the regulatory authority or other appropriate organisation for consent, before proceeding or implementing the remedial measures.

A copy of the discovery strategy must be lodged on site, and provisions made to ensure that all workers are made aware of their responsibility to observe, report, and act on any potentially suspicious, abnormal, unforeseen or contaminated ground and/or groundwater conditions they may encounter.

Depending on the type, nature and extent of any such 'discovery', it may be necessary to halt works in that location until such time as the assessment has been completed. This shall be reviewed on a 'discovery' specific basis and in conjunction with consultation with the client, other technical personnel and/or regulatory/approval organisations.

As a general guide, where such unexpected conditions are encountered the following approach is required as a minimum:

- All discoveries are to be reported to the Site Manager immediately and works at that location are to halt until further notice;
- The Site Manager is to report any such discoveries to the Client and the Consultant;
- Following notification from the Site Manager, the Consultant shall discuss the discovery with the Local Authority and/or other relevant parties and if considered necessary, arrange to meet on site to view the discovery;
- The Consultant shall attend the site to record the location, extent and nature of the discovery and implement an appropriate sampling and analysis regime, taking due account of the type and nature of the discovery, known and probable land uses in that area of the site;
- Where remedial action is required, regulatory consultation and approval will be sought;
- A record will be produced by the Consultant and held on site (with copies held by the Consultant, Client and Local Authority/other relevant organisation), detailing the discovery, assessment works undertaken, findings thereof, confirmation either of no action required or detailing the remedial action taken and validation thereof.

The process is summarised below:

Model Details

Storage is Online Cover Level (m) 65.500

Infiltration Blanket Structure

Infiltration Coefficient Base (m/hr) 0.00000 Diameter/Width (m) 100.0
 Safety Factor 2.0 Length (m) 320.0
 Porosity 0.30 Cap Volume Depth (m) 0.000
 Invert Level (m) 65.000

Hydro-Brake® Optimum Outflow Control

Unit Reference MD-SHE-0129-6800-0500-6800
 Design Head (m) 0.500
 Design Flow (l/s) 6.8
 Flush-Flo™ Calculated
 Objective Minimise upstream storage
 Application Surface
 Sump Available Yes
 Diameter (mm) 129
 Invert Level (m) 65.000
 Minimum Outlet Pipe Diameter (mm) 150
 Suggested Manhole Diameter (mm) 1200

Control Points	Head (m)	Flow (l/s)
Design Point (Calculated)	0.500	6.8
Flush-Flo™	0.198	6.8
Kick-Flo®	0.382	6.0
Mean Flow over Head Range	-	5.5

The hydrological calculations have been based on the Head/Discharge relationship for the Hydro-Brake® Optimum as specified. Should another type of control device other than a Hydro-Brake Optimum® be utilised then these storage routing calculations will be invalidated

Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)	Depth (m)	Flow (l/s)
0.100	4.6	1.200	10.3	3.000	15.8	7.000	23.8
0.200	6.8	1.400	11.0	3.500	17.1	7.500	24.7
0.300	6.6	1.600	11.7	4.000	18.2	8.000	25.5
0.400	6.1	1.800	12.4	4.500	19.2	8.500	26.3
0.500	6.8	2.000	13.1	5.000	20.2	9.000	27.1
0.600	7.4	2.200	13.7	5.500	21.1	9.500	27.8
0.800	8.5	2.400	14.2	6.000	22.1		
1.000	9.4	2.600	14.8	6.500	23.0
